

Narrative Report

In our lesson about Database Security, I learned how to protect data from unauthorized access and threats. The Introduction to Database Security explained the importance of keeping information safe. Authentication and Authorization taught me that authentication checks who the user is, while authorization controls what they can do. In Role-Based Access Control (RBAC), I learned that giving roles to users makes managing permissions easier. Encryption and Data Masking showed how to hide or protect sensitive data so only trusted users can view it. Auditing and Compliance taught me how tracking user actions helps maintain accountability. Finally, Best Security Practices reminded us to use strong passwords, limit user access, and back up data regularly. Overall, I realized that database security is about proper control, protection, and monitoring to keep information safe.
